Rapid Assessment Reference Condition Model

The Rapid Assessment is a component of the LANDFIRE project. Reference condition models for the Rapid Assessment were created through a series of expert workshops and a peer-review process in 2004-2005. For more information, please visit www.landfire.gov. Please direct questions to helpdesk@landfire.gov.

Potential Natural Vegetation Group (PNVG):

R3MASB

Mountain Sagebrush (Cool Sage)

Geographic Range

Mid elevation of the Central Rockies through Montana, Mountain areas of Utah and North west New Mexico/Northeast Arazona.

Biophysical Site Description

This vegetation type is found on all aspects. Pure stands are found in areas with deeper soils and less topographic relief, but it is also common on slopes with a gradual shift to a mixed mountain shrub community on steeper slopes and in drainages. Elevation ranges from 6,600 feet to 9,000 feet and precipitation from 11-20 inches. Soils are deep, well drained with a pH +- 7.0. Soil moistures are udic (not dry for as long as 90 cumulative days) and soil temperatures cryic (very cold soils of the Rocky Mountain region).

Vegetation Description

Dominant shrubs include Artemisia tridentata ssp. Vaseyana, Purshia tridentata and Symphoricarpos oreophilus. Other common shrubs include Amelanchier alnifolia, Chrysothamnus viscidiflorus, Cercocarpus montanus, Tetradymia canescens and Artemisia novae. Other shrubs may be locally common. Herbaceous cover is moderate to abundant ranging from 40-85%. Common grasses include: Festuca idahoensis, Elymus elymoides, Pascopyrum smithii, Elymus trachycaulus, Hesperostipa comata, Nassella viridula, Poa fenderiana, and Poa juncifolia var ampla. Indicative forbs include Eriogonum umbellatum, Antennaria rosae, Balsomorhiza sagittata, Lupinus argenteus, Delphinium nuttallianum, Phlox multiflora, Viola nuttallii.

Disturbance Description

Mountain sagebrush steppe dominated by mountain sage, western snowberry and bitterbrush with a grass and forb understory is believed to be the major pre-settlement vegetation type for the area, although the exact composition of the community before settlement is unknown. Fire is a major disturbance factor for mountain sage (Blaisdell et al 1984, Johnson 2000). Mountain big sagebrush has the fastest recovery rate of

the three subspecies, may be as short as 15 yrs (see FEIS, local data from various monitoring groups - NPS, BLM, TNC, etc). Fire size for this type is larger than other big sagebrush species because of greater fine fuel load but some unburned pockets remain. The fire return intervals reported in the literature for this sage type is 50 years or more (Welch and Criddle 2003). Assuming that recovery rates are correlated with composite fire return intervals, one could posit with some certainty that the fire return interval lies somewhere between 40-75 years. Ranges lie between 30 years near Ponderosa Pine communities and other productive sites (maintaining more early seral types) up to 100 years on north aspects and on rocky slopes (maintaining more late seral types).

Adjacency or Identification Concerns

Differentiation of Mountain Big Sagebrush Steppe from Wyoming Big Sagebrush may be difficult at the ecotone due to physical similarities and hybridization zones (i.e., species concepts become blurred).

Scale Description

Sources of Scale Data 🖌 Literature 🗌 Local Data 🖌 Expert Estimate

Size of disturbance extent will be limited by the variation of topographical features, age classes of the sage over the landscape, and vegetation types, all typical of mountain terrain. Average patch size 100 to 500 acres with larger sizes during drought.

Issues/Problems

In review Bill Baker questions existence of mixed severity component.

Model Evolution and Comments

This model was adapted from the Rapid Assessment model ROSBMT (from the Northern Central Rockies region) to reflect drier climate and longer fire return intervals observed in Southwest Region.

Quality control resulted in deleting some rule violations (improper use of Time Since Disturbance) with no change to model results.

Succession Classes

Succession classes are the equivalent of "Vegetation Fuel Classes" as defined in the Interagency FRCC Guidebook (www.frcc.gov).

Class A 15%	Indicator Species* and	Structure Data (for upper layer lifeform)
